ABSTRACT

Few 3-[6⁷Fluoro-7'-substituted-(1',3')benzothiazol-2'-yl]p-benzene sulphonamido-2-o-nitrobenzene (1,3) thiazoline-4-one were synthesized using appropriate synthetic route. The structure of these compounds was characterized by means of physical constants, elemental analysis, solubility tests, TLC and by UV, IR spectral studies. All the compounds were evaluated for *in-vitro* anti-mycobacterial activity. Compounds showed significant activity.

KEY WORDS: Fluorobenzothiazole, Sulphonamido, Thiazolidinone, Anti-mycobacterial activity.

1. INTRODUCTION

We report herein the new synthesis of fluoro benzothiazoles (Feller, 1995) comprising thiazolidinone derivatives. The sulfonamide drugs were the first effective chemotherapeutic agents to be employed systemically for the prevention and cure of bacterial infection in human beings (Bahar and Siddiqui, 1998). The chemistry and pharmacology of thiazole have been of great interest because of its various biological activities (Jatav, 2006), so that the biological and pharmacological activity of thiazolidinone with fluoro sulphonamidobenzothiazoles may be taken into account for synergism. It is well known that the introduction of fluorine atom into an organic molecule (Conte, 1995) causes dramatic changes in its biological profile, mainly due to high electro negativity of fluorine, the strong carbon-fluorine bond and increased solubility in lipids. In search for new bioactive potent molecule, it was thought worth while to incorporate some additional heterocyclic moieties in the thiazolidinone nucleus and study their biological and pharmacological activity, the review of literature reveal prompted us to synthesis of substituted fluoro sulphonamidobenzothiazolyl thiazolidinone compounds and those will be screened for anti-mycobacterial activity by *in-vitro* method (Shieke and Bobade, 1991) to get potent bioactive molecule.

2. EXPERIMENTAL

The sample compounds were tested *in vitro* by the tube dilution technique using the human virulent H₃₇Rv

strain of *M. tuberculosis*. The tubes were incubated at 37°C for 21 days. Rifampicin and Isoniazide were used as standard for antimycobacterial activity.

Condensation of 2-amino-6-fluoro-7-chloro-(1,3)benzothiazole and p-acetamido benzene sulphonyl chloride (2)

2-amino-6-fluoro-7-chloro (1,3) benzothiazole (0.013 mol) was taken in pyridine (4 ml) and acetic anhydride (20 ml), to this p-acetamido benzene sulphonyl chloride (0.01 mol) were added and the mixture was kept in water bath for 2 hrs. The reaction mixture then poured in to 20 ml of ice cold water. The solid obtained was filtered and recrystallised from dil. ethanol (80%) to get pure compound 6-fluoro-7-chloro-2-(p-acetamido benzene sulphonamido) (1,3)-benzothiazole.

Synthesis of 6-fluoro-7-chloro-2-(p-amino benzene sulphonamido) (1,3) benzothiazole (3)

The derivatives obtained were then hydrolyzed by boiling them in 50 ml of 80% acetic acid for 4 to 5 hrs and the contents were poured onto crushed ice. The obtained hydrolyzed derivatives were filtered at suction and dried.

Synthesis of 6-fluoro-7-chloro-2-[p-(m-nitro benzylidene) amino benzene sulphonamido] (1,3) benzothiazole (4)

0.01 mol of 6-fluoro-7-chloro-2-(p-amino benzene sulphonamido) (1,3) benzothiazoles with 0.015 mol solution of p-nitro benzaldehyde, added 20 ml ethanol and 3-4 drops of HCl and refluxed for 2-3 Hrs. Solution cooled and poured into crushed ice. Recrystallised with benzene and ethanol.

Synthesis of 3-[6'Fluoro-7'-Chloro-(1',3')benzothiazol-2'-yl]p-benzene sulphonamido-2-m-nitrobenzene (1,3) thiazolidin-4-one (5)

A mixture of Schiff's base (0.01 mol) and 0.025 mol of 2-thioglycolic acid heated on oil-bath at 115°-120 ° c for 12 Hrs. After reflux cool and triturated with 10% sodium bicarbonate solution. Crystallized from water.

Synthesis of 3-[6'Fluoro-7'-substituted-(1',3')benzothiazol-2'-yl]p-benzene sulphonamido-2-m-nitrobenzene (1,3) thiazolidin-4-one (B₁-B₁₂)

3-[6'Fluoro-7'-Chloro-(1',3')benzothiazol-2'-yl]p-benzene sulphonamido-2-m-nitrobenzene (1,3) 3-chloro-azetidin-4-one were treated with equimolar quantities of various aromatic amines, refluxed for 2 hours in presence of DMF, recrystallised from alcohol and benzene.

Anti– mycobacterial Screening

Sterile Kirchner’s medium was dispensed in each borosilicate test tube (150 x20mm) and to this sterile horse serum (0.5 mL) was added. The stock solution was sterile by passing through a 0.2 mm polycarbonate sterile membrane (Nuclepore) filters. Further the serial dilution of test compounds were carried out. Test compounds at various concentrations (250, 125, 62, 32, 16, 8, 4 and 1 µg/mL) were added to culture medium in a sterilized borosilicate test tube and strain of *M.tuberculosis* was inoculated at concentration (106 bacilli/mL). The tubes were incubated at 37⁰ for 21 days and then examined for the presence or absence of growth of the test organisms. All experiments were performed in triplicate. The lowest concentration, which showed no visible growth, was taken as the end point i.e. minimum inhibitory concentration (MIC). Rifampicin and Isoniazide (INH) were used as standard for antimycobacterial activity.

3.RESULTS AND DISCUSSION

In present investigation synthesis of several novel 3-[6'Fluoro-7'-substituted-(1',3')benzothiazol-2'-yl]p-benzene sulphonamido-2-substituted (1,3) thiazolidin-4-one (B₁-B₁₂) is reported. All the synthesized compounds exhibited significant anti-mycobacterial activity. In conclusion a new class of different aromatic primary and secondary amines encompassing sulfonamidothiazolidinone to get targeted molecules were synthesized and evaluated for anti-mycobacterial activity.

4.ACKNOWLEDGEMENTS

The authors express thanks to Dr. A.S. Bobde, Haffkine Institute, Mumbai for providing testing facilities for Anti-mycobacterial activity.
